TITLE: Method of Calculating Inner Electric Fields in Complicated
Dipole Structures and Their Application to CaTiO₃ ✓

PERIODICAL: Izvestiya Akademii nauk SSSR. Seriya fizicheskaya, 1960,
Vol. 24, No. 10, pp. 1191 - 1194

TEXT: A general method is suggested for calculating the inner electric
fields in complicated structures, in which there may take place both
parallel and antiparallel ionic displacements in an arbitrary direction.
This method, which was applied to the calculation of fields in CaTiO₃, ✓

type crystals, constitutes a generalization of the methods that are
used for calculating the fields in piezoelectric substances of an
ABO₃-type structure, and proceeds from the respective structure model
of the compound concerned. A total of six different cases were examined.
The calculation was made at the vychislitel'nyy tsentr MGU (Computer

Center of MGU) with the computer "СТРЕЛА" (Strela). The calculation of the fields in CaTiO_3 shows that the distribution of fields in this compound depends only little on the polarizability of Ca ions. It is all the more dependent, however, on the effective ion charge, up to the change of the signs of the fields acting upon the oxygen ions, although the qualitative picture remains unchanged. The fields acting upon Ca ions are only little varied in this connection. In all of the six cases examined the fields are considerably smaller than is the case with the piezoelectric ABO_3 compounds. In this case, as may be seen from the structure symmetry, the field acting upon the Ti ions is exactly vanishing. In BaTiO_3 and PbTiO_3 (Refs. 8 and 9), on the contrary, fields of maximum strength act upon the Ti ions. The basic difference between the fields in CaTiO_3 and in the piezoelectric ABO_3 compounds related to it, is connected with the fact that in the latter the octahedra are greatly deformed, while they are nearly ideal in CaTiO_3 . The relationship

between the anomaly of dielectric properties and the deformation of BO_6 octahedra can be also observed in the case of such ABO_3 compounds as are, e.g., PbZrO_3 , PbHfO_3 , NaNbO_3 . It can be stated that the presence of a deformation of B - O is an indispensable prerequisite for an antipiezoelectric phase transition. The authors thank N. P. Trifonov, collaborator of the computer center of MGU for his assistance in the computations. The present paper was read at the Third Conference on Piezoelectricity, which took place in Moscow from January 25 to 30, 1960. There are 1 figure and 12 references: 4 Soviet.

TITLE: Calculation of Internal Electric Fields in
Perovskite Crystals (CaTiO_3)

PERIODICAL: Kristallografiya, 1961, Vol. 6, No. 1,
pp. 78 - 85

TEXT: In a previous paper (Ref. 13) the present authors gave an account of a general method for the calculation of internal fields in structures having an arbitrary disposition of dipoles. The aim of the present paper is to apply this method to the calculation of fields in the antiferro-electric dipole structure of CaTiO_3 , using a model based on the real structure reported by Kay and Baily in Ref. 14. In the method described by the present authors in Ref. 13, it is assumed that the polarisabilities and effective ion charges are known. The polarisabilities of Ca and O ions were taken from the book by Kittel (Ref. 15) ($\alpha_{\text{Ca}} = 1.1 \cdot 10^{-24} \text{ cm}^3$).

Card 1/5

20024

E032/E314

Calculation of Internal Electric Fields

$\alpha_0 = 2.4 \times 10^{-24} \text{ cm}^3$). It is further assumed that the effective charges of the ions in BaTiO_3 are approximately equal to one-half of the total ion charges. In order to estimate the effect of the assumed magnitude of the charges and polarisabilities on the field distribution, six different variants of the calculation were carried out, in which the charges and polarisabilities were varied within reasonable limits. The results obtained are summarised in Table 3, which gives the internal fields in CaTiO_3 . The first five variants are based on the real structure of CaTiO_3 , shown in Fig. 2. For comparison, variant 6 is based on values of the f and h sums calculated for undispersed positions of the ions. All the calculations were carried out on the electronic computer "Strela" at the Computation Centre of MGU.

X-ray determination of symmetry ...

temperature, and that K and Bi, and/or Na and Bi are statistically distributed in the sites of the elementary cell with the coordination number 12. Splitting of some lines was observed, but could not be measured accurately. CrK radiation and an PKA-143 (RKD-143) camera (produced at the FKhI imeni L. Ya. Karpov) were therefore used. The following lattice constants were determined from the splitting of the line with

$\sum h_i^2 = 8$: $(K_{0.5}Bi_{0.5})TiO_3$ is tetragonal with $a = 3.913 \pm 0.003 \text{ \AA}$,
 $c = 3.993 \pm 0.003 \text{ \AA}$, $V = 61.1 \pm 0.15 \text{ \AA}^3$; $(Na_{0.5}Bi_{0.5})TiO_3$ is rhombohedral
with $a = 3.891 \pm 0.002 \text{ \AA}$, $\alpha = 89^\circ 36' \pm 3'$, $V = 58.7 \pm 0.1 \text{ \AA}^3$. Furthermore,
the change in the lattice constants with temperature up to 500°C was deter-
mined for $(K_{0.5}Bi_{0.5})TiO_3$. At 270°C the tetragonal passes over into a

pseudocubic phase. The slightly diffuse lines make more accurate determina-
tion impossible. On the basis of previous conclusions (Ref. 4: Yu. N.
Venetsev, G. S. Zhdanov, Izv. AN SSSR. Ser. fiz., 21, 2275 (1957)) the
distortion can be assumed to be tetragonal. The cubic phase occurring from
 410°C onward makes the radiographs clearer. The authors thank V. A. Isupov
who supplied the samples. There is 1 figure.

TITLE: Investigation of some solid solutions based on the ferroelectric-ferromagnet bismuth ferrite [Report, Symposium on Ferromagnetism and Ferroelectricity held in Leningrad 30 May to 5 June 1963].

SOURCE: AN SSSR. Izv. Ser.fiz., v.28, no.4, 1964, 683-690

TOPIC TAGS: ferromagnetism, ferroelectricity, bismuth ferrite, bismuth ferrite solid solution

ABSTRACT: By investigating solid solutions of $\text{Bi}_2\text{O}_3 \cdot \text{Fe}_2\text{O}_3$ in PbTiO_3 , some of the authors, together with others, were able to show the existence of the compound BiFeO_3 with the perovskite structure and strong ferroelectric properties. This work is reviewed, and later investigations are reported of the electric and magnetic properties of solid solutions containing BiFeO_3 . The solutions discussed are the two-component systems in which one component is BiFeO_3 and the other is LaFeO_3 , LaCrO_3 ,

Card 1/3

ACCESSION NR: AP4030644

PbTiO₃, BaTiO₃, PbZrO₃, LaAlO₃, or SrSnO₃. Of these solutes, two are ferromagnetic, two are ferroelectric, one is antiferroelectric and two are perovskites with normal magnetic and electric properties. Phase diagrams are given for the PbTiO₃, LaCrO₃, and BaTiO₃ solutions. Curves of magnetization versus temperature are given for various compositions of the LaCrO₃ and PbZrO₃ solutions, and curves of dielectric constant versus temperature for the LaAlO₃, PbZrO₃ and BaTiO₃ solutions. The Neel point is plotted against composition for all the solutions except those containing SrSnO₃, which could not be obtained as a single phase. Extrapolation of the Curie points of the LaAlO₃ and PbZrO₃ solutions to zero concentration confirmed the high ferroelectric Curie point (about 350°C) of BiFeO₃. The weak ferromagnetic properties of BiFeO₃ persisted in solutions containing high concentrations of materials without peculiar magnetic properties. Particularly interesting is the concentration dependence of the spontaneous magnetization of the LaCrO₃ solutions; the magnetization increases discontinuously as the system crossed the boundary from the ferroelectric to the antiferroelectric state. The LaFeO₃ solutions are said to have behaved similarly, but as these solutions have been discussed in detail elsewhere (Yu.B. Roginskaya, Yu. N. Venetsev, G.S. Zhdanov and S.A. Fedulov, Kristallografiya, 8, 1963), the data are not given. An anomaly in the Mossbauer spectrum of the SrSnO₃ solutions that was pre-

TITLE: Electrical effects of a large meteorite

SOURCE: Geomagnetizm i aeronomiya, v. 5, no. 2, 1965, 284-288

TOPIC TAGS: meteorite, shock wave, astrophysics, lower atmosphere, atmospheric physics, electric effect, atmospheric electricity

ABSTRACT: Some of the electrical effects associated with the passage of a meteorite through the lower atmosphere (e.g., polarization of the air region in the terrestrial electric field traversed by the ionized body, the form of the shock wave generated by the meteorite, the length of the high-temperature trail, and the electrical conductivity of the air) are examined. It is found that the gas entering into a shock wave having a less than critical radius assumes a conductivity great enough to supplant the electric field. The form of the shock wave of the meteoric body is determined by the formula $z = AR \sup 2$, where $A \approx 0.98/d$, d is the size of the body, z and R are the cylindrical coordinates with axis z directed along the axis of the trail, and with an origin connected with the meteoric body. The values characterizing the gas in the coordinate system do not depend on time, and the formulas for convective heat transfer coincide with the condition that the temperature is constant along the current lines. It is found that in the case where $z < z_{\text{sub crit}}$ the polarized region is delimited by the front of the shock wave, while in the case where $z > z_{\text{sub crit}}$ it is delineated by the current lines flowing from the frontal line determined by

nuclear physics apparatus

ABSTRACT: The fact that there are many different methods for the continuous industrial measurement of the thickness of products which are accessible from one side only seems to indicate that probably none of them is completely satisfactory. Consequently, to improve on the accuracy of such measurements and yet keep the size of the necessary devices within reasonable limits, the authors developed a new method based on nuclear magnetic resonance. The unit, requiring access to the sample from only one side, yields the results in digital

Card 1/2

L 33478-66

ACC NR: AT6011936

form. It can register the thickness of ferromagnetic materials, of magnetic coating on non-ferromagnetic parts, and of nonmagnetic coating on ferromagnetic parts. Since magnetic induction in an arbitrary section of a magnetic circuit of a converter depends on the magnetic "resistance" of such a circuit, the change in thickness causes changes in magnetic induction which, in turn, are converted into changes in frequency by means of the NMR converter. The article presents the structural diagram of the thickness measuring unit, discusses the choice of converter dimensions, and offers some results of the testing of a prototype capable of measuring the thickness of structural steel sheets 0 to 2 mm thick with a reproducibility close to 99%. The conversion coefficient is 8 kc per 0.01 mm. Orig. art has: 3 formulas and 4 figures.

TITLE: Generalized criterion of the information content, weight, complexity, and reliability of measuring instruments

SOURCE: Ref. zh. Avtomat. telemekh. i vychisl. tekhn., Abs. 11A283

REF SOURCE: Izv. Leningr. elektrotekhn. in-ta, ch. 2, vyp. 56, 1966, 60-62

TOPIC TAGS: measuring instrument, information content, reliability

ABSTRACT: It is suggested that the information content obtained from a measuring instrument be considered as its determinative parameter: $q = \log N$, where N - equivalent number of various gradations of measurand, q - information content of the instrument. Methods for determination of instrument information content with various errors are considered. For one type of measuring instrument, a function $N = f(n)$ is obtained, where n - the total number of parts of the instrument. Determination of joint factors is reduced to finding invariant relations among the number of elements, information content, and average life. The possibility of developing such a criterion for a specific type of measuring instruments is demonstrated. It is proven that an invariant relation for modern electronic equipment may serve for evaluating the speed of operation of measuring instruments. Bibliography of 3 titles. B. U. Title: Combined Withdrawal of Liquor from Cooking Vessels and Decaners

Original

Periodical: Gidroliznaya i lesokhim. prom-st', 1956, No 2, 18-19

Abstract: On combined withdrawal of liquor (drawing off a portion of concentrated liquor from cooking vessels and the remainder from decaners) yield of alcohol per one t of cellulose was 70 l in lieu of 54-58 l. At the same time duration of liquor removal from cooking vessels has been decreased from 2 to 1.5 hours. Total volume of liquor is 9 m³ per ton of cellulose with average sugar concentration of 2.1%. These results were attained on partial effectuation of the scheme of combined draw off procedure and operation schedule.

AUTHOR: Ivanova, Ye. A. 53

TITLE: The effect of somatotrophic hormone in anterior lobe of pituitary body on bone under conditions of irradiation 19

SOURCE: AN SSSR. Doklady, v. 150, no. 3, 1963, 671-674

TOPIC TAGS: bone growth, somatotrophic hormone effects, irradiation effects

ABSTRACT: Authors irradiated the extremities of a 4-day old rat with X-rays of a 2000 Gamma dose and found that this causes a deep-seated disturbance of the cartilaginous growth membrane with subsequent cessation of the growth of bone. The introduction of a somatotrophic hormone in a 200-Gamma dose in daylight for 36 to 44 days of testing causes a hypertrophy of the cartilaginous cells and tissues and it retards the differentiation of the bones in the region of the epiphysis and metaphysis and it somewhat smooths the changes in the bone structure but not in a state to normalize their development. Orig. art. has: 1 table.

TITLE: Lifetime of current carriers in space charge layer of GaAs-p-n-transitions

SOURCE: Fizika tverdogo tela, v. 6, no. 3, 1964, 776-779

TOPIC TAGS: space charge, p n transition, volt-ampere characteristic, vacuum diode, current density

ABSTRACT: The lifetime of current carriers in a space charge layer of GaAs-p-n-transition has been determined from the straight portion of the statistical volt-ampere characteristics, under conditions when the experimental volt-ampere characteristics of a diode could be compared quantitatively with theory. The Sah-Noyce-Shockley (Proc. IRE, 45, 1228, 1957) equation for the volt-ampere characteristics is used to predict the lifetime τ_0 , i.e.,

$$I_{sx} = I_0 e^{\frac{qV}{kT}} = qn_i \frac{kT}{qE_m} \frac{1}{\tau_0} e^{\frac{qV}{kT}},$$

Card 1/2

ACCESSION NR: AP4019837

and is compared to the data from two vacuum diodes (Nos. 58 and 64). The results show that T_2 does not depend on the nonequilibrium carriers up to current densities of 1 amp/cm², nor on temperature in the interval 293 to 545K. Its value was estimated to lie between 10⁻⁹ and 10⁻⁸ sec. "The authors express their gratitude to R. F. Kazarinov and V. I. Stafeyev for their help." Orig. art. has: 4 formulas, 1 table, and 1 figure.

TITLE: Study of how alkaline earth oxides affect the electrode
properties and chemical stability of lithium silicate
glasses

PERIODICAL: Leningrad. Universitet. Vestnik, Seriya fiziki i khimii,
no. 1, 1963, 104-114

TEXT: , Glasses containing 24, 27, or 30 mole% Li_2O and an addition of
0.20 mole% of BaO , CaO , MgO , or BeO were studied by plotting the curves
E versus pH. Results: BaO shifts the upper limit of the H^+ function
range by 0.1 - 0.3 pH units into the alkaline region. In some cases,
also the lower limit of the H^+ function is shifted in positive direction.
The exchange constant of Li - Ba glasses is somewhat lower than that of
binary glass. CaO addition narrows the H^+ function range in the
alkaline region, extends the transition range by ~1 pH unit, and increases.
Card 1/3

the exchange constant. MgO has the same effect but much more intensively. The shift in the upper limit of the H^+ function caused by 15 mole% MgO at 27 mole% Li_2O is 3.3 pH units, but that due to 15 mole% CaO is only 1 pH unit. The shift caused by BeO is 2 - 3 pH units at no more than 2.5 mole%; at 15 - 20 mole% BeO, this shift in acid direction is 3-4 pH units. The effect on the exchange constants increases as follows: $BaO < CaO < MgO < BeO$. This is probably due to weaker H-bonds owing to the formation of strongly acid ionogenic groups. An addition of small amounts of BaO changes the stability of glass to H_2O but slightly, whereas 20 mole% BaO reduces its chemical stability. The stability is increased by up to 10 mole% CaO, and decreased by higher CaO concentrations; but it remains higher than that of binary glass. In an acid solution, 5 mole% CaO increases the stability, but at 10-20 mole% CaO the Li_2O leaches out intensively. MgO has a similar effect on the chemical stability. BeO increases the stability in H_2O and in acids.

Conclusion: The stability of the glass is increased by elements that form ionogenic groups in lithium silicate glasses such as MgO and

 TITLE: A method for obtaining synthetic lubricating oils. Class 23, No. 176350
 SOURCE: Byulleten' izobreteniy i tovarnykh znakov, no. 22, 1965, 42-43
 TOPIC TAGS: lubricant, ester, carbon, synthetic material
 ABSTRACT: This Author Certificate presents a method for obtaining synthetic lubricating oils representing esters of two-base acids. A mixture of two-base acids with the number of carbon atoms exceeding 11 is used as the two-base acids. The carbon atoms are obtained from the C₁₇-C₂₀ fraction of synthetic fatty acids.

TITLE:

New Data on the Devonian Fauna of the Kuznetskiy Basin
(Novyye dannyye po faune devona Kuznetskogo basseyna)

PERIODICAL:

Doklady Akademii nauk SSSR, 1959, Vol 125, Nr 3, pp 611-613 (USSR)

ABSTRACT:

The Devonian of the Kuznetskiy Basin is sufficiently well investigated although all the species of the fauna have not yet been described. Within a small faunal assemblage in the area of the village Lebedyanka (district of Anzhero-Sudzhenskiy) forms have been found, which are commonly known, but have hitherto been regarded as lacking in the Devonian of this region. Using this new faunal complex, the stratigraphic knowledge was completed and the paleogeography of the Devonian ocean completely reconstructed. On this basis the authors propose three possible divisions of the Devonian of Lebedyanka: lower sequence with Gruenewaldtia and many brachiopods, middle sequence with countless Euryspirifer cheehiel and others (Refs 2,4) and upper sequence with scarce E. cheehiel, many Anathyris helmerseni and in the higher part A. phalaena. The previous long established Upper Givetian age applies only to the middle sequence. The fauna of the upper sequence resembles

Card 1/3

New Data on the Devonian Fauna of the Kuznetskiy Basin SOV/20-125-3-41/63

the fauna of the so-called Zarubinskiy limestone, which was at one time considered Givetian (Ref 3) and at another time Frasnian (Ref 5). The determination of the age of the lower sequence will meet with difficulties as long as there is no monographic description of its fauna. Its upper part was determined as Eifelian by K. V. Radugin. But Stringocephalus along with other accompanying fauna suggests rather a Givetian age and above all an age older than the beds with E. cheehiel. The fauna with E. cheehiel of the northern Kuzbass may have inherited an older, Eifelian fauna which existed in the same water (Refs 2,4). There may have been an open-sea connection in the western part of this northern section. This applies also to later periods (the E. cheehiel fauna). This fauna spread from a center in the region of the present Lebedyanka village. The ways of spreading are, however, too little known. A direct connection between the Minusinsk sea and the northern Kuznetsk water did not exist in the late Givetian (Ref 6). Thus the placing of the whole Kuzbass of Givetian time in the same zoogeographical province with Kazakhstan must be corrected, for the northern border region should be included in another, more northern province. At the same time the Lebedyanka fauna

Card 2/3

New Data on the Devonian Fauna of the Kuznetskiy Basin SOV/20-125-3-41/63

shows a considerable mixture of eastern Asiatic (Chinese) forms.
